Three arrows agree. The units do not.

Bitcoin products, Ether products and tracked stablecoin value all contracted.

ALIGNED FLOWS

Two pipe meters

Bitcoin products: -$1.282bn

Ether products: -$0.365bn

Five U.S. sessions

SEPARATE STOCK

One reservoir

Stablecoins: -$5.148bn

Dollar-valued endpoint change

Seven calendar days

All values are estimates. The stablecoin change is not appended to the ETP-flow total.

Breadth can strengthen while addition remains invalid.

The two aligned flows combine to -$1.647bn.

These estimates share the same five-session window and product-flow meaning.

ESTIMATED NET OUTFLOW MAGNITUDE · US$ MILLIONS

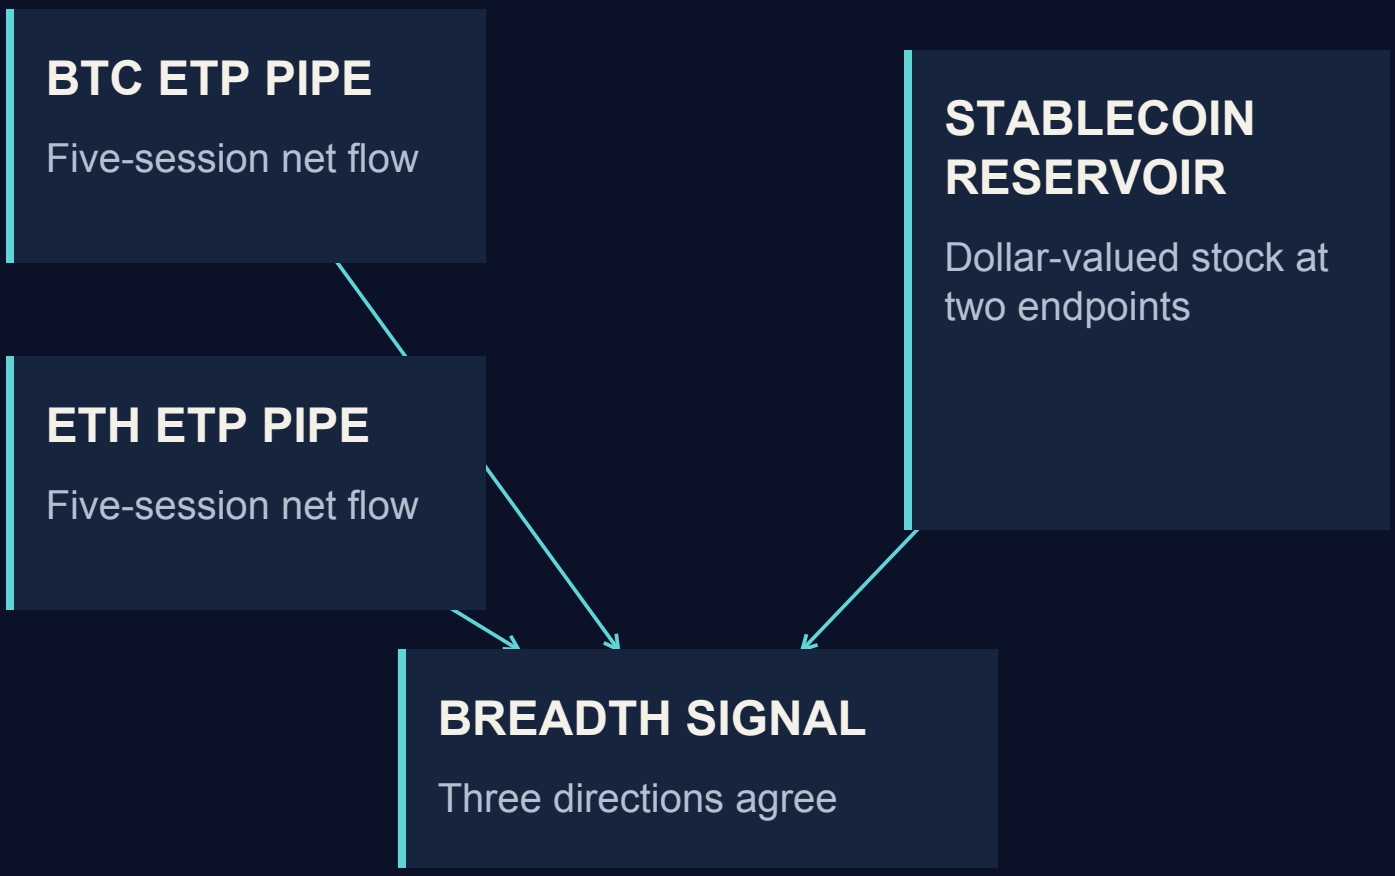

US-dollar magnitudes shown for legibility; every bar represents a negative net-flow total.

Addition is earned by compatible units and clocks.

S1 · S2 · S5 | Farside estimates · 2–6 November 2026

Two pipes.
One separate reservoir.

The three gauges can point down without tracing the same dollars.

No evidence traces particular capital among these channels.

Agreement is directional—not a capital-flow identity.

A clean sum can still be a bad measurement.

The arithmetic test comes after the instrument test.

READING	TYPE / CLOCK	ADD TO ETP FLOW?
Bitcoin products	Flow · 5 sessions	YES
Ether products	Flow · 5 sessions	YES
Stablecoin value	Stock change · 7 days	NO
Three directions	Breadth observation	COMPARE

A shared dollar denomination does not make differently constructed measures additive.

> **Match unit, window and object before adding.**

A green Wednesday inside a red week.

Weekly direction was clear; the path was not uninterrupted.

ONE SESSION

Wednesday rose

- Bitcoin: +$74.6m
- Ether: +$53.0m
- Both product groups positive

FULL WINDOW

Week still fell

- Four negative sessions
- Bitcoin: -$1,281.7m
- Ether: -$365.2m

A negative week was not five uninterrupted negative days.

> **Keep the route visible when summarizing the destination.**

What this rule can prove next—not today.

A dated breadth observation is not evidence of predictive value.

01

1 · Freeze method

Keep series, units and windows unchanged.

02

2 · Observe

Record the next complete window.

03

3 · Repeat

Build enough comparable periods.

04

4 · Compare

Test outcomes against alternatives.

05

5 · Decide

Only then evaluate predictive usefulness.

No trade, transfer, allocation or portfolio change was executed.

> **Repeat the same measurement before judging the rule.**

Direction can agree without dollars combining.

Three gauges strengthened a breadth observation. They did not create one capital-flow total.

WEAK QUESTION

How much money left crypto?

Which gauges contracted—and are their units additive?

Keep the three arrows. Keep the measurement boundary too.

Complete-window breadth · Predictive value UNKNOWN

> **Ask what the instruments measure before asking what the sum means.**
