

A total needs a clock

The addition can be right while the headline is premature.

FROM A CHANGING TABLE TO A SCREENSHOT

A neat number can hide an unfinished row.

US Bitcoin ETF session: 25 Sep 2026. Observed 26 Sep HKT. Interface proposal; no measured user experiment.

Keep time and completeness attached when a number travels.

One session. Two unfinished sums.

Both displayed totals matched the available numbers. The row still had gaps.

FIRST OBSERVATION

−\$11.8m

7 of 12 fund cells contained numbers.

5 cells were missing.

Available-cell sum matched the displayed total.

LATER OBSERVATION

+\$37.5m

10 of 12 fund cells contained numbers.

2 cells were missing.

Available-cell sum matched the displayed total.

Ordered morning snapshots on 26 Sep HKT, for the same 25 Sep US session. Precise provider update times unknown. Neither is a final daily result.

The observed sign changed before the data was complete.

The missing values can change the sign

For the later snapshot: total = 37.5 + R, in USD millions. Hold displayed entries fixed.

ASSUMED R**CALCULATED TOTAL****READ AS****-50****-12.5**

Example outflow

+10**+47.5**

Example inflow

R is the sum of the two missing contributions. These are invented examples, not estimates, bounds or probabilities. Revisions can also change the total.

No defensible bound on R was established.

Keep the context on the card

An explanatory design sketch. Arrows show information that should travel together.

PARTIAL SUM: +\$37.5m

10 of 12 fund values present. Two still missing.

WHICH MOMENT?

US session date. Retrieval time and timezone. Provider update time if known.

WHICH EVIDENCE?

Missing fund names. Exact saved snapshot. Earlier versions retained.

Proposed display, not an implemented dashboard or measured improvement. Retrieval time must not stand in for an unknown provider update time.

A screenshot should retain the conditions behind its number.

Change the label as evidence arrives

A simple proposed rule for a dashboard builder.

01

Missing cells

Show the partial sum and name the missing constituents.

02

All cells numeric

Check the sum against the displayed total at its published precision.

03

Sum agrees

Describe the row as numerically complete and reconciled.

04

Issuer verification

Needs separate evidence. Do not imply it from a full row.

Cell coverage is not confidence. Keep snapshots and revisions.

A complete row is still weaker than independently verified reports.

Leave room for two missing funds

Ten of twelve counts the cells. It does not measure certainty.

THE CARD SOMEONE COPIES

+\$37.5m

**Partial sum.
10 of 12 values present.**

Add the session and retrieval time. Link the saved row.
Keep the earlier version when the next report arrives.

Design proposal / No dashboard outcome measured

**Keep the observation time, coverage and revision history
visible.**

Reopen the table. Keep the snapshot.

A changing source and a frozen research record serve different purposes.

S1 Farside Bitcoin ETF flow table

Changing table; US session 25 Sep 2026 · checked 26 Sep 2026

S2 The ETF Total That Was Still Arriving

2026-09-26 · checked 26 Sep 2026

Farside is the aggregation publisher. This is not an issuer audit or a claim about final Friday flows. The two R values are illustrative.

The observations are dated; the interface is an authored proposal.
