

The total has no headcount

One large suitcase arrives. Several smaller ones leave. Imagine that room.

CASH BALANCE

More money

The arrival brings more cash than the departures remove.

The balance rises.

PEOPLE IN THE ROOM

Fewer people

One person enters; several people leave.

The room gets quieter.

This room is fictional. The fund data on the next page is observed.

A positive total cannot count agreement.

One plus sign. Opposing components.

Bitcoin funds, 28 Sep to 2 Oct 2026. Net flow in USD millions.

IBIT: +450.2

One fund, summed across the five sessions.

OTHER 11: -209.1

The other funds, combined over the same dates.

ALL 12: +241.1

Arrows mean addition, not transfers between funds.

Farside cells, not independently audited issuer records. Revisions are possible.

+450.2 minus 209.1 equals +241.1.

Count funds. You get another answer.

Same completed week. Each fund gets one count, regardless of size.

NET DOLLARS

+\$241.1m

A large positive component can exceed several negatives.

Size affects the total.

FUND COUNT

4 / 5 / 3

4 positive, 5 negative, 3 zero for the week.

Each fund counts once.

One investor may use several funds; one fund may serve many investors.

Dollar weight and fund breadth answer different questions.

Same \$1,000. Different crowds.

Two imaginary cases show information that a total cannot recover.

1,000 PEOPLE

Each adds \$1. Total added:
\$1,000.

ONE PERSON

Adds \$1,000. Total added:
\$1,000.

SAME REPORTED TOTAL

Two alternative cases; do not add them together.

The arrows show alternative mappings to a total, not two cash transfers.

Neither scene describes the observed week.

Subtract a column. Keep the world intact.

Removing IBIT from the sum does not recreate a market where it never existed.

WHAT WE CALCULATED

**Other funds:
-\$209.1m**

The recorded weekly sum for eleven products.

No investor path is traced.

WHAT WE DID NOT RUN

**A world
without IBIT**

People might choose different products.

Those choices need separate evidence.

No behavioral simulation or investment return prediction was performed.

The remainder is accounting, not a counterfactual.

Before drawing the crowd, define it.

A useful participation question names the unit it wants to count.

VAGUE INFERENCE

Did everybody come back?

**More funds? More holders?
More flow per asset dollar?**

These are different measures. Fund tables can support fund counts; unique-holder claims need different records.

Investor identities, motives and future returns are not established.

Keep the total. Ask for the missing denominator.

The numbers and their limits

The Special reconciles the week. This story examines what the sum cannot tell US.

S1 Farside Bitcoin fund flows

2026-10-06 capture

S2 October 6 Special reconciliation

2026-10-06

Five completed US sessions only. Later incomplete sessions excluded. Provider tables can change; hypothetical crowds are not measured investors.

An accurate sum can still support an inaccurate story.
