

The second payment is the harder test.

A robot can sell once on promise. Repetition has to survive the work.

THE REPEAT-PAYMENT TEST

The hard question: who paid again?

A diligence frame, not an investment or procurement recommendation.

The first sale opens the door. The second tests value.

One market. Five different receipts.

Revenue, orders, hours, output and margin answer different questions.

ACTIVITY

Did work happen?

Units and operating hours

Customer-confirmed output

A named task and period

ECONOMICS

Did value repeat?

Same customer pays again

Service-adjusted margin

Demand beyond one buyer

Activity can be real while repeat demand and deployment economics remain unpublished.

No single headline closes the commercial case.

Three windows. No complete view.

Each disclosure adds evidence and leaves a different gap.

WINDOW	WHAT IT SHOWS	WHAT STAYS UNKNOWN
UBTECH	RMB590.3m humanoid revenue; 921 units	Repeat cohorts; category service-adjusted margin
AGILITY	65,000 hours; 9 facilities; \$300m+ order	Milestone realization; broad repeat demand
BMW	90,000+ components; ~1,250 hours	Price; vendor margin; completed reorder

UBTECH margin shown publicly is 44.7% group-wide. Agility metrics are company-reported.

Compare like with like before ranking companies.

Follow the receipt chain. Do not skip a link.

A commercial story strengthens as evidence survives each boundary.

This is a screening model. The reviewed sources do not publish every link for one customer.

Repeat payment connects useful work to continuing demand.

The second payment has five opponents.

A pilot budget can tolerate friction that scaled operations cannot.

01

Reliability

Useful shifts must survive interventions and exceptions.

02

Integration

Safety, IT and process work return in the real cost.

03

Service

Field engineering and maintenance can absorb gross profit.

04

Budget

The buyer must choose the robot again over alternatives.

05

Concentration

One large contract cannot stand in for a customer cohort.

Complete only when customer, period and economics connect.

Repetition forces the robot to compete with alternatives.

Ask for the next receipt. Keep UNKNOWN honest.

A practical screen for the next filing, order announcement or customer case.

QUESTION	PASS EVIDENCE	UNTIL THEN
Who paid first?	External customer and recognized revenue	UNKNOWN
Who paid again?	Renewal, expansion or repeat order	UNKNOWN
What work survived?	Customer-confirmed output and period	UNKNOWN
What remained?	Margin after installation and service	UNKNOWN
How broad is demand?	Cohort beyond one concentrated buyer	UNKNOWN

Missing disclosure stays UNKNOWN.

The next useful headline is smaller—and harder.

Same customer. Measured work. Another payment. Economics after service.

LOUD HEADLINE

How many robots were sold?

Who paid again after the work?

Keep revenue, orders, hours, output and margin in separate columns. Connect them only when the evidence does.

Research only · No investment, procurement or deployment action

The second payment is where the robot story becomes commercial.
